PRECISIONTM

UAN

A high performance liquid nitrogen fertiliser for crops and pasture.

Precision UAN is a stable solution which contains three forms of nitrogen. This means it remains in the soil for crops or pasture to utilise as required, and is not prone to N volatilization.

Nitrogen cap? No problem!

The efficiency of Precision UAN enables you to achieve maximum growth with less than 140 units of N per year. The performance from a typical pastoral application of 25L/ha (10 units of N) of Precision UAN is comparable to 65kg (30 units) of coated Urea.

Takes care of new growth

Safer for seeds and seedlings than urea due to its lower initial pH, ensuring a strong start for your new crop or pasture.

Year round benefits

Effective source of Nitrogen all year round. Works well in low soil temps or dry periods when solid urea is less effective.

Higher grade of plant growth

Promotes quality growth and better feed value along with lower leaf nitrate levels compared with solid urea. These results will be reflected in your animals health and performance.

Easy to apply liquid

Being a true liquid solution, Precision UAN is compatible with all spray nozzles including crop spraying equipment, liquid fertiliser applicators, fertigation and irrigation systems.

More time between applications

Provides consistent growth for longer periods compared with solid urea creating a more sustained feed supply and reducing your yearly application costs.
